General Annotations	ENTREZ_GENE_SUMMARY	The protein encoded by this gene removes 5' overhanging flaps in processes the 5' ends of Okazaki fragments in lagging strand DNA physical interaction between this protein and AP endonuclease 1 c base excision repair provides coordinated loading of the proteins c thus passing the substrate from one enzyme to another. The prote the XPG/RAD2 endonuclease family and is one of ten proteins ess DNA replication. DNA secondary structure can inhibit flap processi trinucleotide repeats in a length-dependent manner by concealing flap that is necessary for both binding and cleavage by the protein gene. Therefore, secondary structure can deter the protective func protein, leading to site-specific trinucleotide expansions. [provided 2008]
